Abstract

Live coding is a method of performance that presents audio and visual content to audiences through programming. Often "showing the code" is a fundamental part of the performance in order to retain the attention of the audience and provide a measure of authenticity.

Currently missing within the research within live coding is a visualisation of the code that represents the artists intent. Previous visualisation techniques present an abstract and often disjoint representation from the associated code. Missing within this context is a formal analysis of how to best represent the artist's intent visually and a formal analysis of the target audience.

Introduction

-code is often difficult to quickly understand -some observers may lack the experience to understand the software or the programming process

-how can we improve source code comprehension? -how can we aid understanding of the programming process? -better yet, how can we better communicate the programmers intention?

-techniques such as modelling or code documentation arent dynamic or flexible -dont allow for close to realtime understanding -an effective technique is the use of visualisations -it would be valuable to use visualisations as a means to communicate the programmers intention

1.1 Summary - remove

-this thesis will explore code visualisations -specifically, it will investigate visuals within the combination of the domains of software and music -will be using live coding as a platform and case study for this (will discuss later) -will develop and test code visualisations on audiences with audiences of varied levels of experience with programming, addressing code comprehension

1.2 Background

1.3 Theoretical Framework

Literature Review

2.1 Live Coding

(focus on developing a narrative concerning what needs to be done within live coding to achieve the software engineering goals and what needs to be done to develop successful visualisations within the field of live coding)

Live coding describes the process of exposing the programming process to a live audience. -talk more about what live coding is

Live coding history... . -talk more about history of live coding

There exists much discussion within the live coding research body (eg. ...) about the potential for live visual manipulation and examination of the current progress within the field to achieve this.

2.1.1 Music vs Visualisation

In addition, there has been a move towards manipulation of the visuals in synchronisation with the
